Assignment 3 Class Relationships

The classes that I have in my code are Account (SavingsAccount and CheuqingAccount) Bank and Program. For the Accounts its part of the creation of the bank account process. Each account has its own storage and are connected to the main account class. There they are allowed to withdraw or deposit money The bank class contains and stores the account number. The program class contains all the interfaces and all the outputs. Program also has the error prompts when something is not imputed correctly.

I did not find this assessment very difficult as classes have become more familiar with me from the last assessment. The book as well as the notes from class were very helpful with any problems I had.
